

# SMART CONTRACT SECURITY AUDIT OF

## **Summary**

Audit Firm: Guardian Audits

**Client Firm: NFTR** 

Final Report Date - April 8, 2023

#### **Audit Summary**

NFTR engaged Guardian to review the security of its NFT name marketplace. From the 1st of April to the 8th of April, a team of 2 auditors reviewed the source code in scope. All findings have been recorded in the following report.

Notice that the examined smart contracts are not resistant to internal exploit. For a detailed understanding of risk severity, source code vulnerability, and potential attack vectors, refer to the complete audit report below.

Blockchain network: Ethereum

## **Project Overview**

## **Project Summary**

Project Name	NFTR
Language	Solidity
Codebase	https://github.com/NFTRegistry/NameMarketplace
Commit(s)	Initial: deba81c173b944d8401bd2c665dd97ae23e9916f

## **Audit Summary**

Delivery Date	April 8, 2023
Audit Methodology	Static Analysis, Manual Review

## **Vulnerability Summary**

Vulnerability Level	Total	Pending	Declined	Acknowledged	Partially Resolved	Resolved
Critical	2	0	0	0	0	0
• High	2	0	0	0	0	0
<ul><li>Medium</li></ul>	4	0	0	0	0	0
• Low	4	0	0	0	0	0

## **Audit Scope & Methodology**

#### **Scope**

ID	File	SHA-1 Checksum(s)
NMKT	NameMarketplace.sol	277b2bc2368dc911f0174b228c770fa6bc2b4dda
NFTR	NFTRegistry.sol	d3dfcf1e7bfd919caf3802d2e5b07c86653a8717

#### **Methodology**

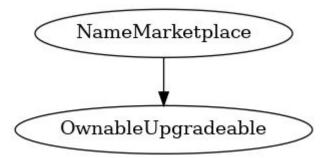

The auditing process pays special attention to the following considerations:

- Testing the smart contracts against both common and uncommon attack vectors.
- Assessing the codebase to ensure compliance with current best practices and industry standards.
- Ensuring contract logic meets the specifications and intentions of the client.
- Cross-referencing contract structure and implementation against similar smart contracts produced by industry leaders.
- Thorough line-by-line manual review of the entire codebase by industry experts.

#### **Vulnerability Classifications**

Vulnerability Level	Classification
<ul><li>Critical</li></ul>	Easily exploitable by anyone, causing loss/manipulation of assets or data.
• High	Arduously exploitable by a subset of addresses, causing loss/manipulation of assets or data.
<ul><li>Medium</li></ul>	Inherent risk of future exploits that may or may not impact the smart contract execution.
• Low	Minor deviation from best practices.

# **Inheritance Graph**

# **Findings & Resolutions**

ID	Title	Category	Severity	Status
NFTR-1	Two Names For One Token	Logical Error	<ul><li>Critical</li></ul>	Unresolved
NMKT-1	No Bids Can Be Entered	Logical Error	• Critical	Unresolved
NMKT-2	Overwriting Previous Name	Unexpected Behavior	• High	Unresolved
NMKT-3	Griefing Name Sellers	Griefing	• High	Unresolved
NMKT-4	Inaccurate Event Data	Events	<ul><li>Medium</li></ul>	Unresolved
NMKT-5	Inconsistent Encoded Names	Logical Error	<ul><li>Medium</li></ul>	Unresolved
NMKT-6	Reset Offers on Fee Change	Logical Error	<ul><li>Medium</li></ul>	Unresolved
NMKT-7	Unable To Withdraw Bid	Unexpected Behavior	<ul><li>Medium</li></ul>	Unresolved
NMKT-8	Unnecessary Casting	Best Practices	• Low	Unresolved
NMKT-9	Using delete	Best Practices	• Low	Unresolved
<u>NMKT-10</u>	Improper Visibility	Best Practices	• Low	Unresolved
<u>NMKT-11</u>	Loop Optimization	Optimization	• Low	Unresolved

### **NFTR-1 | Two Names For One Token**

Category	Severity	Location	Status
Logical Error	<ul><li>Critical</li></ul>	NFTRegistry.sol: 273	Unresolved

#### **Description**

Names could be transferred to an NFT with an existing name but the tokenByName mapping still contains the overwritten name pointing to the NFT. As a result, two different names may point to the same NFT.

Consider the following scenario:

- 1) Alice owns an NFT with name "Alice"
- 2) Bob owns an NFT with name "Bob"
- 3) Name "Alice" is transferred to Bob's NFT
- 4) tokenByName is updated to reflect that "Alice" points to Bob's NFT.
- 5) tokenByName still has an entry for name "Bob" also pointing to Bob's NFT.
- 6) It now appears that Bob is now the owner of both names "Bob" and "Alice".
- 7) A user purchases name "Bob" but ends up receiving name "Alice" upon transfer.

#### **Recommendation**

If a name may be transferred to an NFT with an existing name, dereserve the old name using releaseTokenByName.

## NMKT-1 | No Bids Can Be Entered

Category	Severity	Location	Status
Logical Error	<ul><li>Critical</li></ul>	NameMarketplace.sol: 376	Unresolved

#### **Description**

Initially, when no bids have been entered, the existing bid will have default values – address(0) as the collection and 0 for the tokenId. The zero address does not have function ownerOf, so the call to getOwner will revert. As a result, no bids can be entered.

### **Recommendation**

Bypass the ownership check when there are no existing bids.

## **NMKT-2 | Overwriting Previous Name**

Category	Severity	Location	Status	
Unexpected Behavior	<ul><li>High</li></ul>	NameMarketplace.sol	Unresolved	

#### **Description**

When a bid is accepted through acceptBidForName or an offered name is purchased through buyName, there is no check that the NFT the name shall be transferred to is already named. As a result, a user may unexpectedly lose their old name upon transfer.

#### **Recommendation**

Consider if owned names should be overwritten upon transfer. If necessary, clearly document such behavior.

## **NMKT-3 | Griefing Name Sellers**

Category	Severity	Location	Status
Griefing	<ul><li>High</li></ul>	NameMarketplace.sol	Unresolved

#### **Description**

It is simple for a malicious actor to grief a seller by placing a bid higher than the previous and then withdrawing the bid or transferring the tokenTo to another address. As a result, any bids made with true buying intention are lost and the seller is unable to sell his name.

#### **Recommendation**

Consider allowing for a few blocks to pass before the bid can be overwritten so that a malicious actor risks losing the funds sent to make the ineffectual bid.

## **NMKT-4** | Inaccurate Event Data

Category	Severity	Location	Status
Events	<ul><li>Medium</li></ul>	NameMarketplace.sol: 262	Unresolved

#### **Description**

string memory name = toLower(nftr.tokenName(collectionFrom, tokenFrom))

is performed after the transfer is already made. As a result, the event doesn't emit the name that has been transferred but the empty string.

#### **Recommendation**

Grab the name from the toToken or cache the name prior to transfer.

### **NMKT-5** | Inconsistent Encoded Names

Category	Severity	Location	Status
Logical Error	<ul><li>Medium</li></ul>	NameMarketplace.sol	Unresolved

#### **Description**

There may be potential issues stemming from name parameters being lowered when getting the NFT with the provided name, but the encodedName being produced from a non-parsed input.

Consider the following scenario:

- 1) Bob owns an NFT with name "DIGITAL"
- 2) Alice calls enterBidForName and passes "digital" for the name parameter.
- 3) Bob calls acceptBidForName with name "DIGITAL", but the encoded name does not match the encoded name generated by Alice's "digital".
- 4) Bob's transaction reverts and is unable to accept Alice's bid.

#### **Recommendation**

Lower the inputted name prior to encoding.

## NMKT-6 | Reset Offers on Fee Change

Category	Severity	Location	Status
Logical Error	<ul><li>Medium</li></ul>	NameMarketplace.sol: 327	Unresolved

#### **Description**

If the owner changes the feePerc, even if they lower it, all offers with a different fee will need to be reset due to a fee mismatch. A seller would prefer a lower fee so it is unexpected for their offer to be rendered invalid.

#### **Recommendation**

Compare the offer's fee percentage against an upper bound rather than an exact check.

.

## NMKT-7 | Unable To Withdraw Bid

Category	Severity	Location	Status
Unexpected Behavior	<ul><li>Medium</li></ul>	NameMarketplace.sol: 427	Unresolved

#### **Description**

There is potential for a user to be unable to withdraw their bid.

Consider the following scenario:

- 1) Bob bids for the name "Alice".
- 2) He then receives the NFT named "Alice" through secondary markets or a direct transfer.
- 3) Bob is unable to withdraw his bid value because he now owns the NFT named "Alice".

#### **Recommendation**

Consider whether it is necessary to check for ownership when withdrawing a bid for a name.

If necessary, properly document such behavior for users.

•

## **NMKT-8 | Unnecessary Casting**

Category	Severity	Location	Status
Best Practices	• Low	NameMarketplace.sol: 157	Unresolved

## **Description**

\_WETH is already an address so it is unnecessary to cast it to one.

## **Recommendation**

Remove address(\_WETH) cast.

## NMKT-9 | Using delete

Category	Severity	Location	Status
Best Practices	• Low	NameMarketplace.sol	Unresolved

## **Description**

delete on a mapping entry can be used to reset to defaults rather than setting a zeroed off Offer/Bid.

## **Recommendation**

Consider using delete if only default values are necessary.

## NMKT-10 | Improper Visibility

Category	Severity	Location	Status
Best Practices	• Low	NameMarketplace.sol	Unresolved

## **Description**

toLower has visibility public but it under the internal functions section.

## **Recommendation**

Consider marking the function with visibility internal or move it to a different section.

## NMKT-11 | Loop Optimization

Category	Severity	Location	Status
Optimization	• Low	NameMarketplace.sol	Unresolved

## **Description**

The length of bStr can be cached. Furthermore, because a name's length is restricted in NFTR, the index can be incremented in a unchecked block.

#### **Recommendation**

Consider the above gas optimizations.

## **Disclaimer**

This report is not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. This report is not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts Guardian to perform a security assessment. This report does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model or legal compliance.

This report should not be used in any way to make decisions around investment or involvement with any particular project. This report in no way provides investment advice, nor should be leveraged as investment advice of any sort. This report represents an extensive assessing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk. Guardian's position is that each company and individual are responsible for their own due diligence and continuous security. Guardian's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies, and in no way claims any guarantee of security or functionality of the technology we agree to analyze.

The assessment services provided by Guardian is subject to dependencies and under continuing development. You agree that your access and/or use, including but not limited to any services, reports, and materials, will be at your sole risk on an as-is, where-is, and as-available basis. Cryptographic tokens are emergent technologies and carry with them high levels of technical risk and uncertainty. The assessment reports could include false positives, false negatives, and other unpredictable results. The services may access, and depend upon, multiple layers of third-parties.

Notice that smart contracts deployed on the blockchain are not resistant from internal/external exploit. Notice that active smart contract owner privileges constitute an elevated impact to any smart contract's safety and security. Therefore, Guardian does not guarantee the explicit security of the audited smart contract, regardless of the verdict.

## **About Guardian Audits**

Founded in 2022 by DeFi experts, Guardian Audits is a leading audit firm in the DeFi smart contract space. With every audit report, Guardian Audits upholds best-in-class security while achieving our mission to relentlessly secure DeFi.
